

“4D” microprinted magnetic micro-robots for remote manipulation of cells

Roxane Pétrot

My background

Education

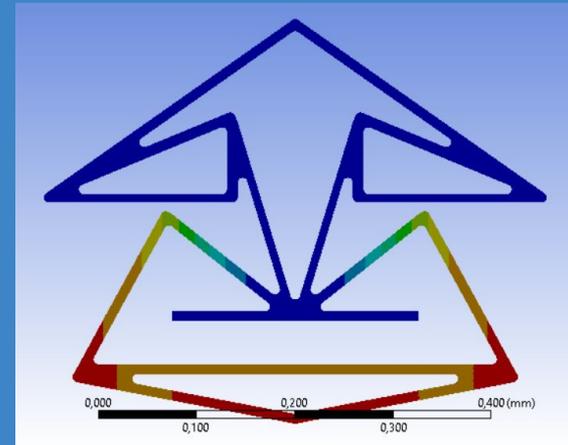

- cell biology
- MRI, magnetism
- electronics, signal processing
- programming

Penn. aug. 2018 - dec. 2018
UNIVERSITY of PENNSYLVANIA

- biomechanics
- mechanics of solids
- simulation

My background

Work and research

PETZL Blue-collar internship - 2017

headlamp thermal stability testing:

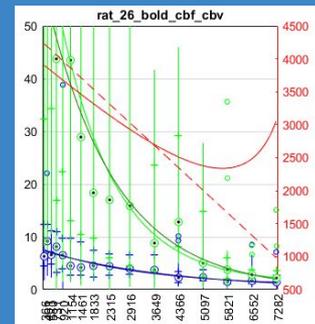

- electronic circuit
- data acquisition
- data analysis

GIN M1R - 2018

fMRI data analysis:

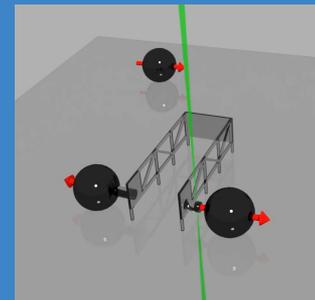

- analysis algorithms
- complex display
- MATLAB

G2E Lab M2R - 2019

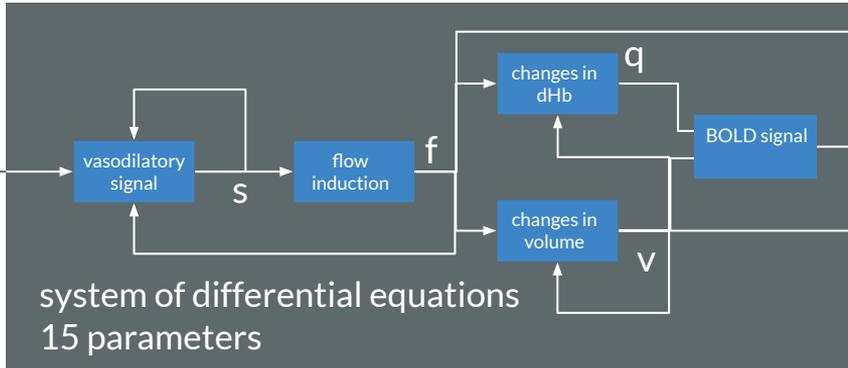

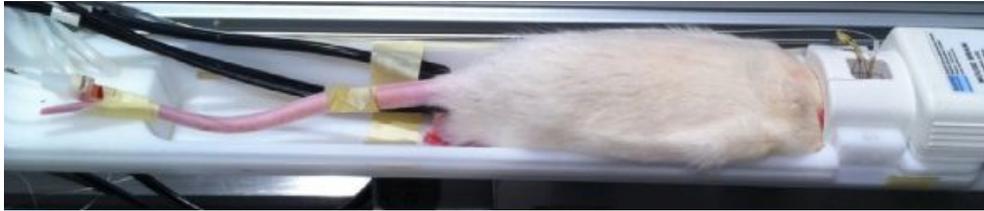

magnetic μ -robots:

- design, simulation
- μ -fabrication
- article redaction

Scientific work - 1/2

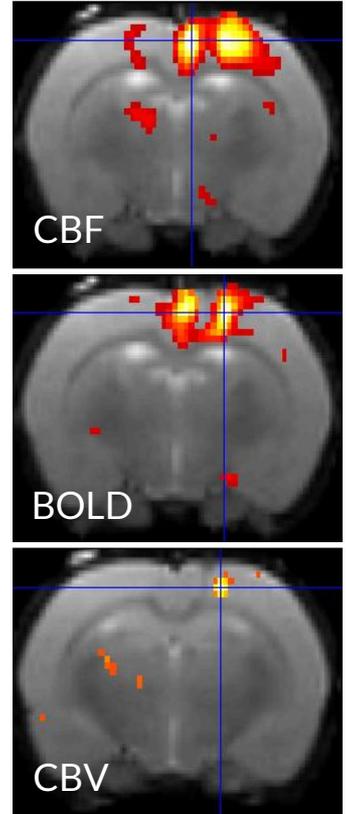

Analysis of a biophysical model of multi-modal data obtained by functional MRI coupled to EEG

blood flow

blood oxygen level

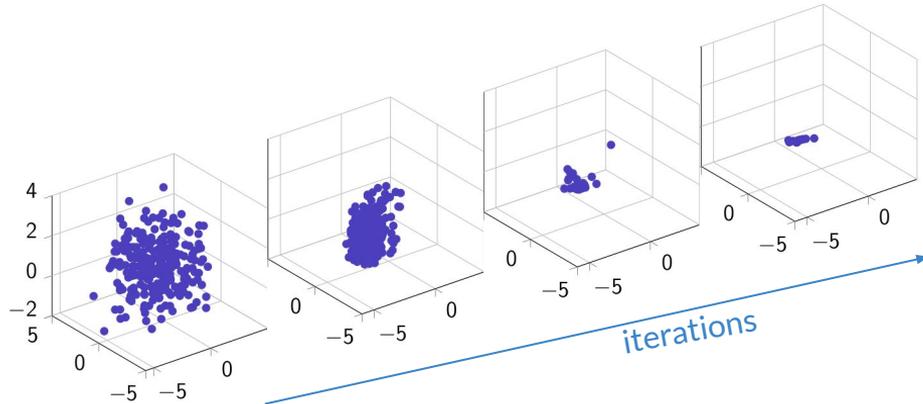

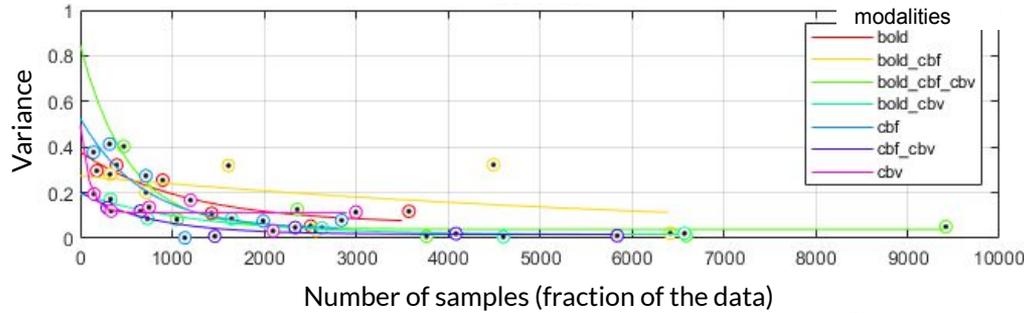

blood volume

originality: literature/estimation → extraction from data

Scientific work - 2/2

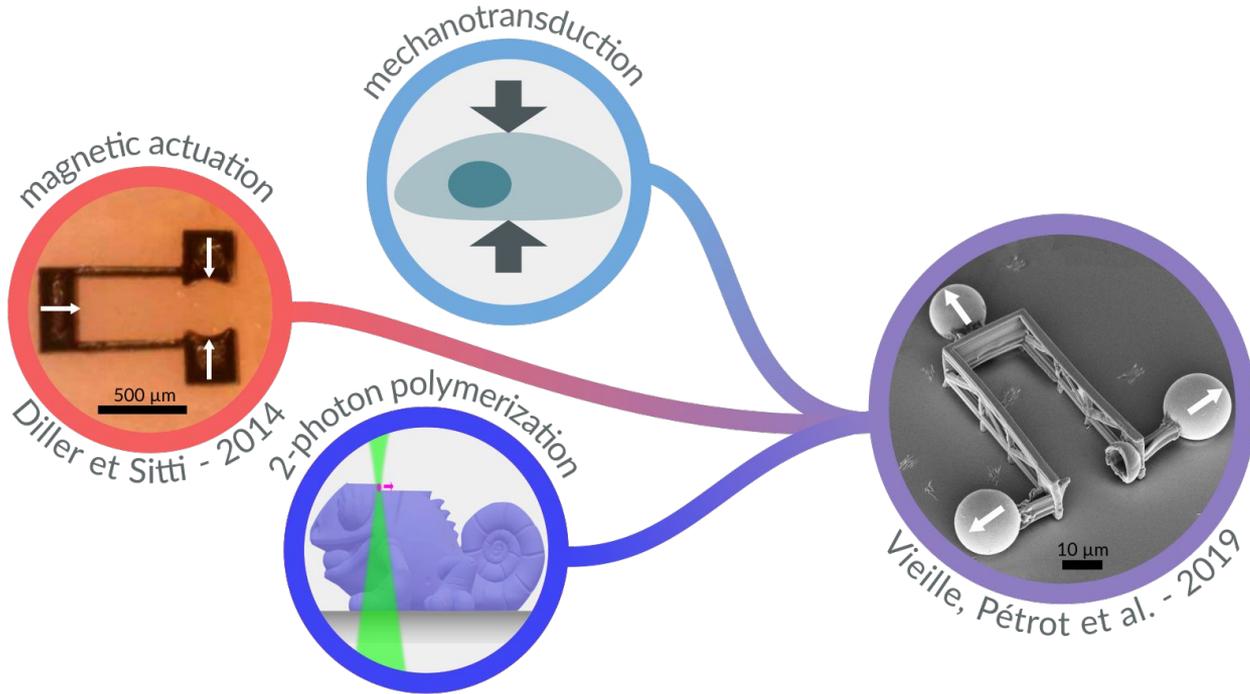

Rat #32 - Param: spike exponent

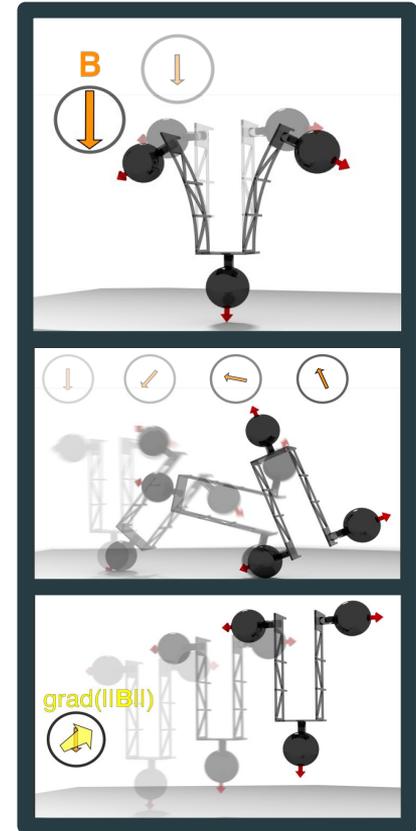

- Analysis of a big amount of data
- For each rat
 - fit 20 times on various fractions
 - plot uncertainty for each parameter as a function of the amount of data
 - compare between modalities
- Verify the results

Thesis project - 1/3

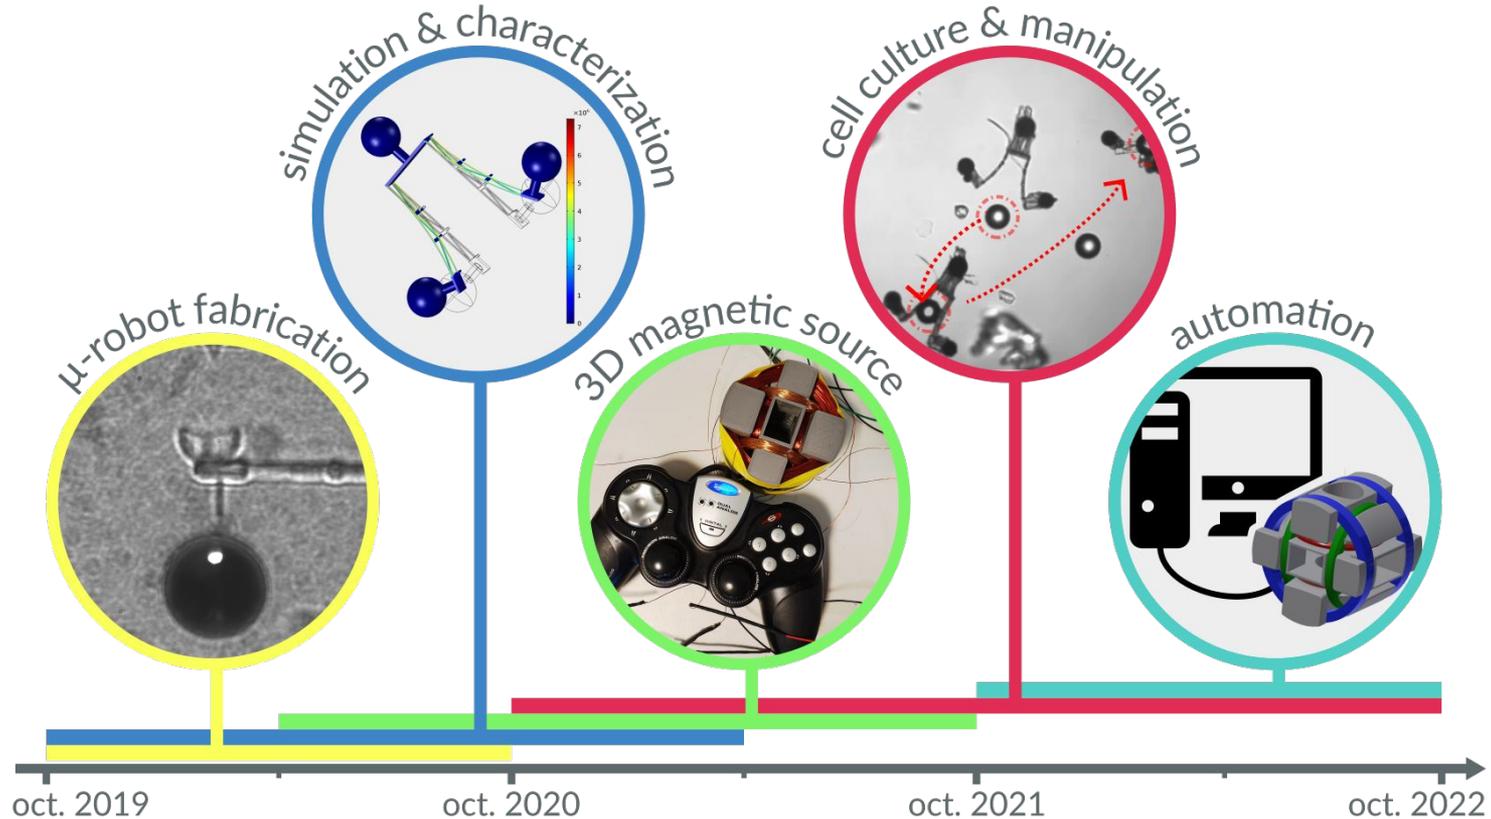

“4D” microprinted magnetic micro-robots for remote manipulation of cells

actuation modes

Thesis project - 2/3

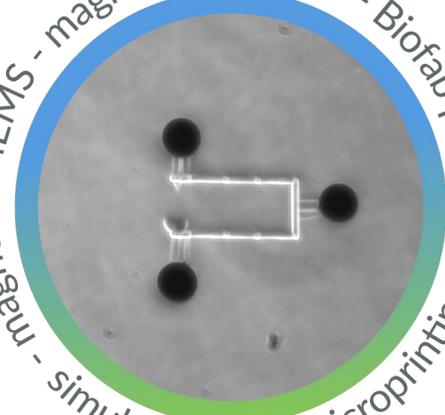

Thesis project - 3/3

Thibaut Devillers
NEEL
institut

Mag-MEMS for med-tech
& energy harvesting
(25 years)

Magneto-active substrates
for mechano-transduction
(5 years)

magnetic MEMS - magnetic materials - Biofab platform - simulation - 3D microprinting

G2E Lab
Grenoble Génie Electrique
Grenoble Electrical Engineering
Orphée Cugat
PhD advisor

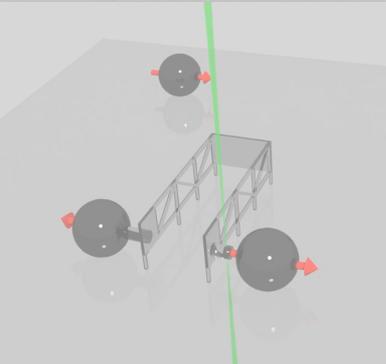

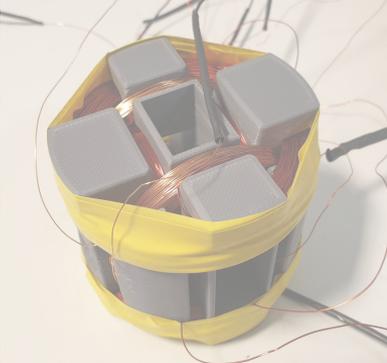

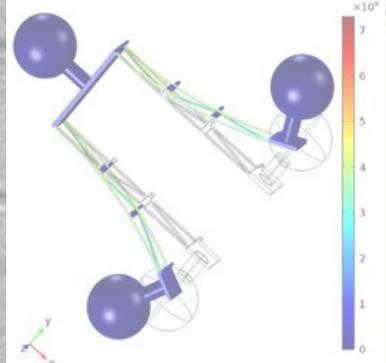

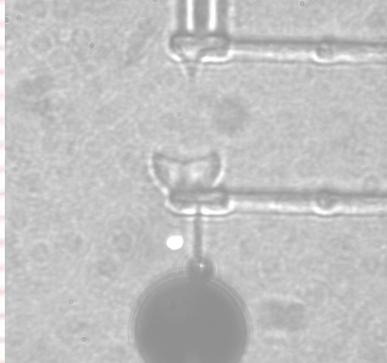

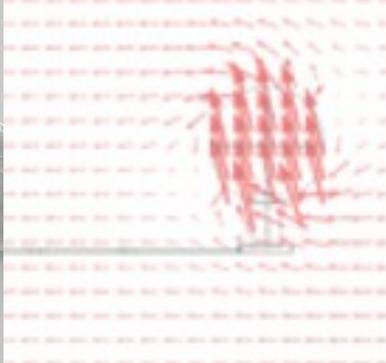

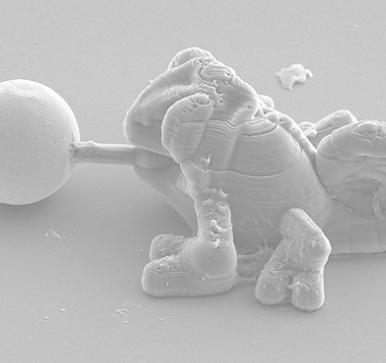

Magnetic μ -printed
objects (2 years -
PhD V. Vieille)

Olivier Stéphan

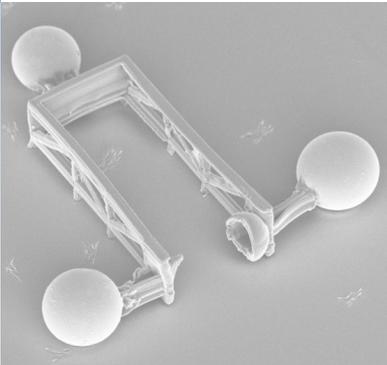

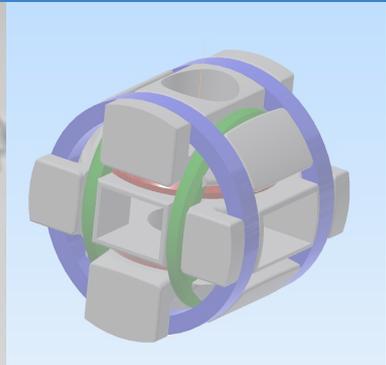

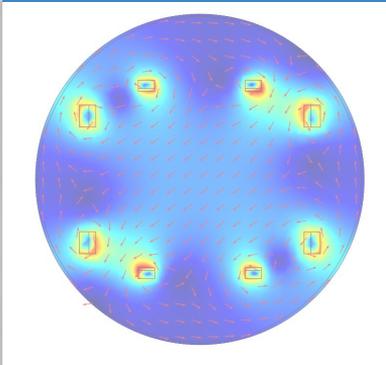

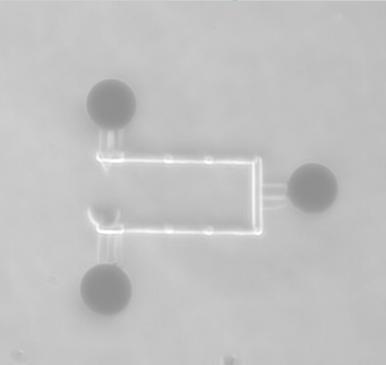

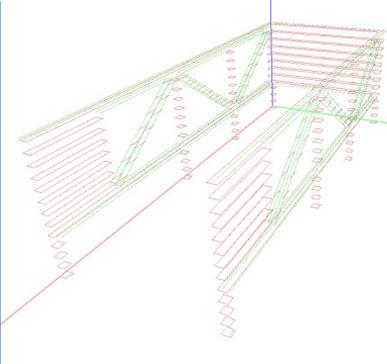

available. Although substantial research has been devoted to producing 3D-printed microscale robotic tools, the tools are typically made of nonresponsive, stiff materials. The use of 4D printing in the field of small-scale robots remains unexplored because of challenges in miniaturizing smart materials with available 3D printing techniques. Producing arbitrary shapes made of two-way responsive materials is also crucial for the successful development of tomorrow's robotic actuators. The integration of other materials, such as magnetic or light-responsive micro- and nanostructures, to form 4D-printed composite components will also bring new opportunities in smart robotic actuators. We encourage the robotics community to explore radically new material and fabrication approaches to make 4D printing as ubiquitous as 3D printing.
30 May 2018, Science Robotics

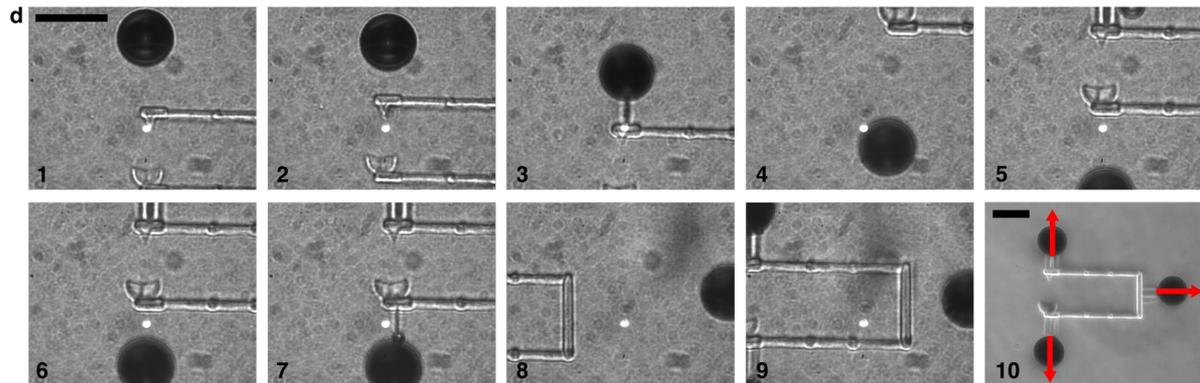

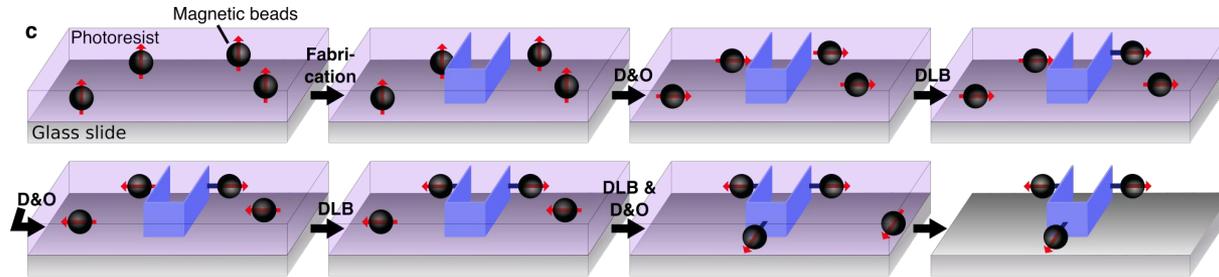

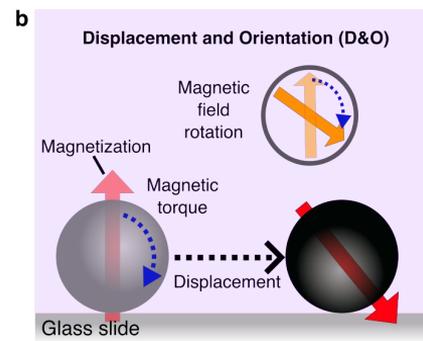

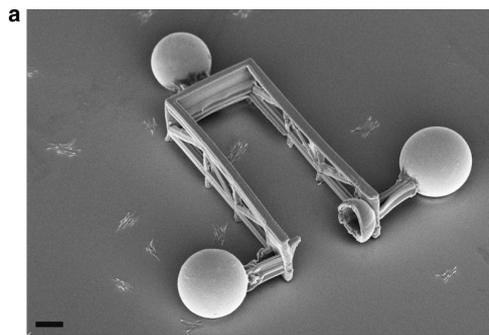

these cells have the ability for tumor recurrence [5]. However, cellular heterogeneity has been masked for a long time because previous biological studies are mainly based on manipulating and analyzing cells at the bulk-scale, which interpreted all phenomena by using average results. Until today, single-cell study still has been recognized as the most straightforward way to performance comprehensive heterogeneity study from the aspects of cellular behavior to genetic expression. Comprehensive single-cell study heavily relies on the use of high-throughput and efficient tools for manipulating and analyzing cells at the single-cell level.

1 February 2019, Micromachines

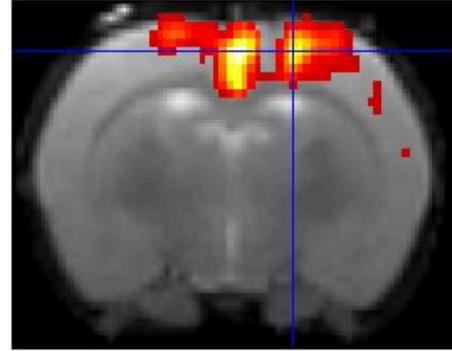

Thank you for your attention.

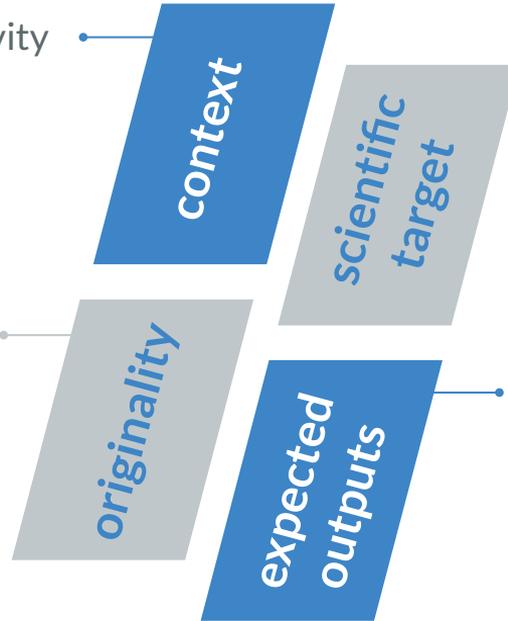

Scientific work - 1/2

Analysis of a biophysical model of multi-modal data obtained by functional MRI coupled to EEG

- models linking neural activity to fMRI signals
- fMRI & EEG data from 13 rats
- MATLAB code

- extract 15 parameter values combining 2 optimization methods (usually taken from literature or estimated)

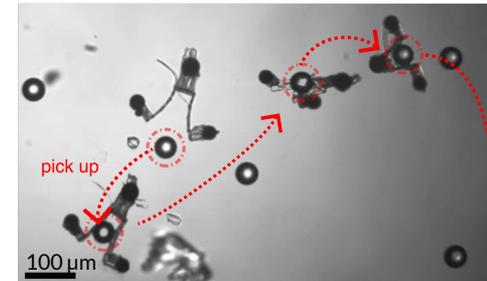

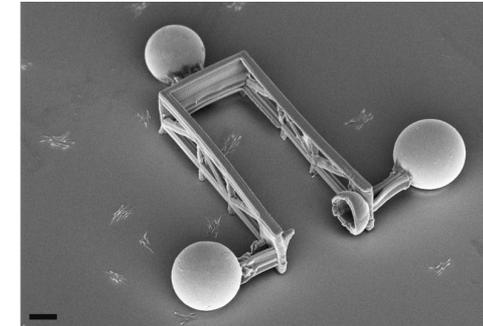

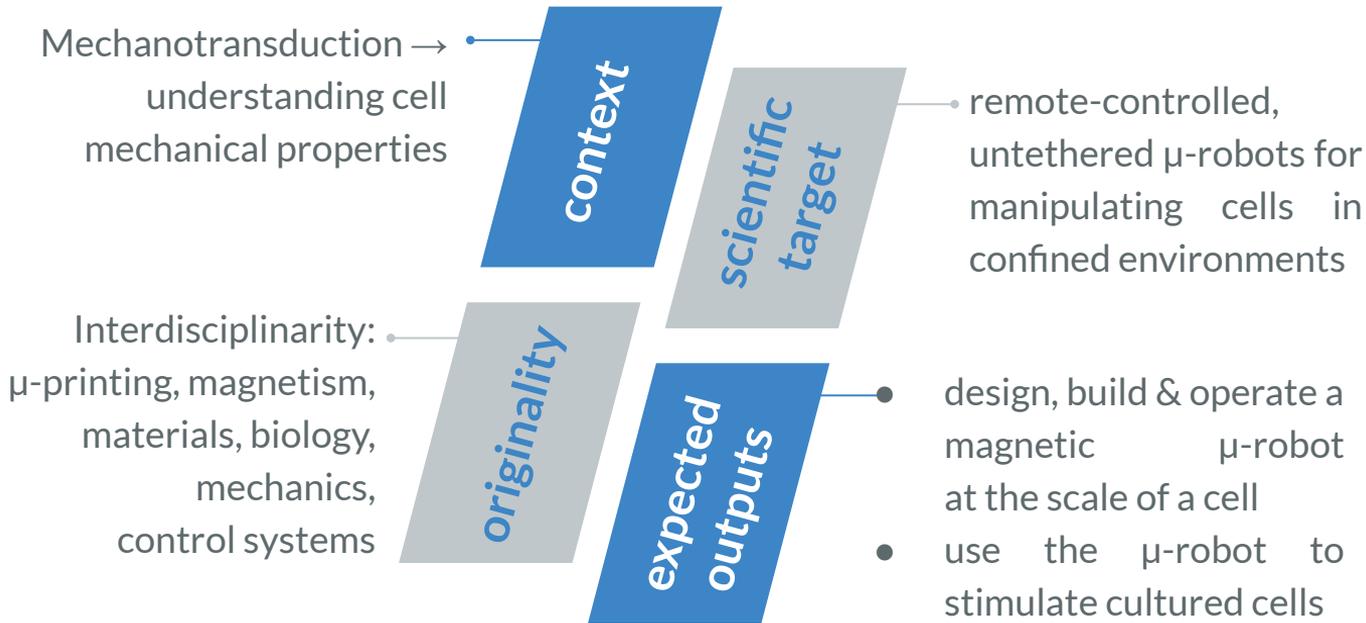

• Better understand brain activity
 → develop models to link data from different neuroimaging modalities
 → study the influence of the parameters on the signals observed

Assess if there exists a clear link between physiological parameters and biophysical modelling of fMRI data

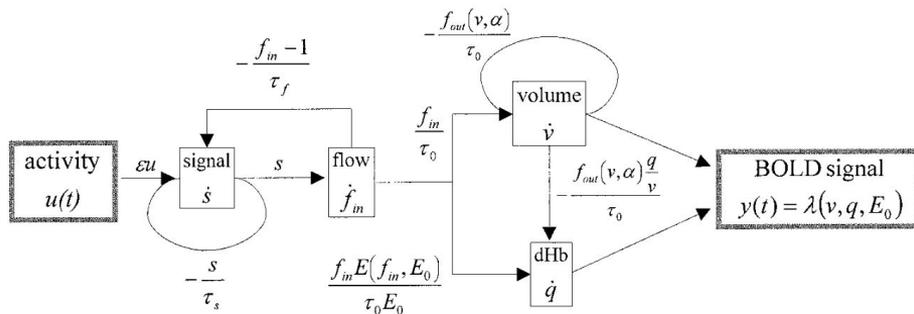

Thesis project - 1/3

“4D” microprinted magnetic micro-robots for remote manipulation of cells

The Balloon Model

Variable	Définition
u	Stimulation
f_{in}	Flux sanguin local
v	Volume de sang désoxygéné local
y	Signal BOLD

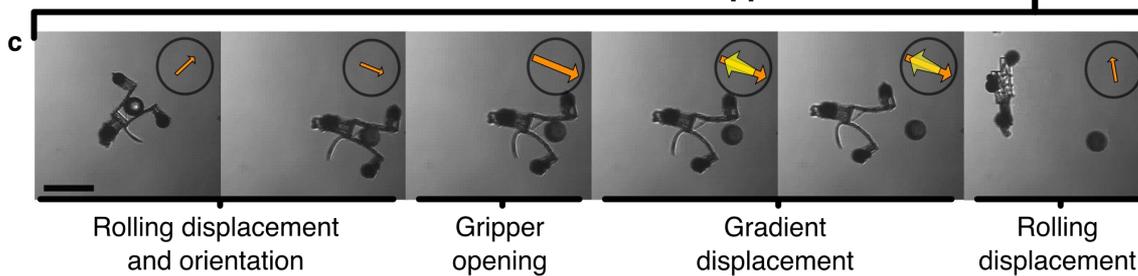

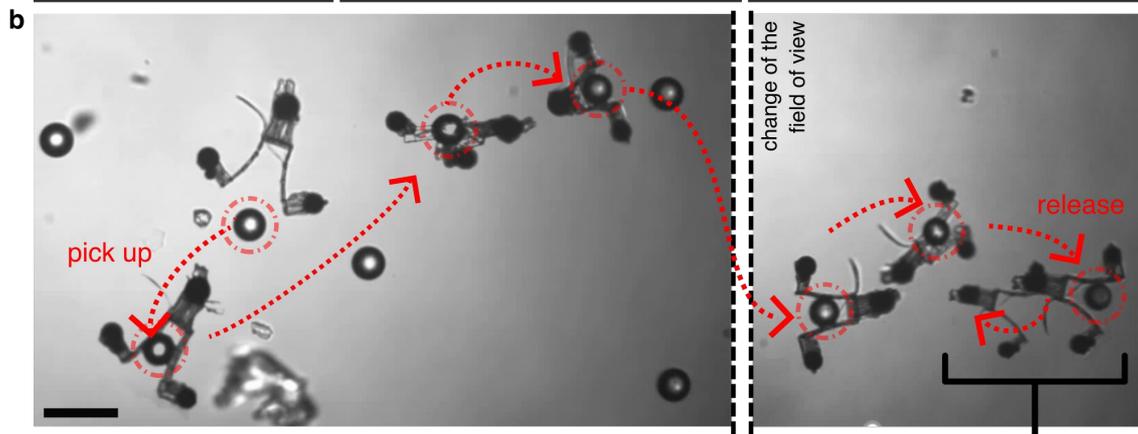

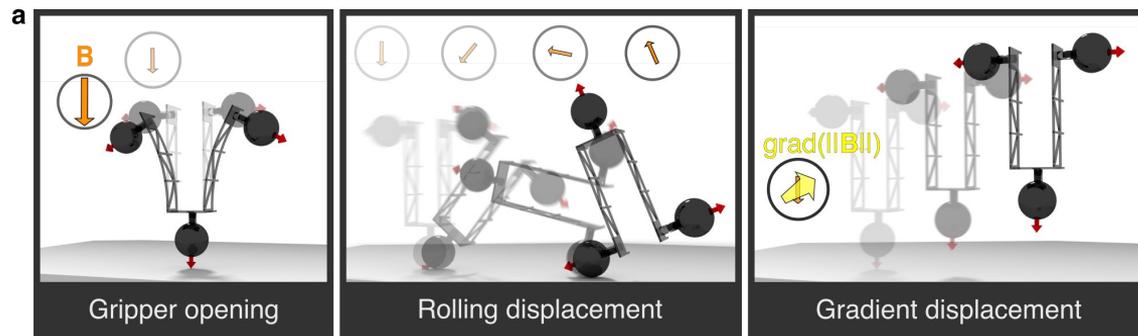

$$\theta = \{A; B; C; D; E; se; sd; ar; tt; \alpha; \epsilon; E_0; V_0; F_0; amplCBV\}$$

$$\left\{ \begin{aligned} \frac{dn_e}{dt} &= -En_e - \exp \left(A + Bu^{se} + D^T \begin{pmatrix} n_e \\ s \\ f_{in} - 1 \end{pmatrix} \right) n_i + Cu^{se} \\ \frac{dn_i}{dt} &= n_e - 2En_i \\ \frac{ds}{dt} &= n_e - sd s - ar (f_{in} - 1) \\ \frac{d \ln(f_{in})}{dt} &= \frac{s}{f_{in}} \\ \frac{d \ln(v)}{dt} &= \frac{1}{tt} \frac{f_{in} - v^{\frac{1}{\alpha}}}{v} \\ \frac{d \ln(q)}{dt} &= \frac{1}{tt} \left(\frac{1 - (1 - E_0)^{\frac{1}{f_{in}}} f_{in}}{E_0} \frac{f_{in}}{q} - v^{\frac{1}{\alpha} - 1} \right) \end{aligned} \right.$$

$$y(t) = V_0 [k_1 (1 - q(t)) + k_2 \left(1 - \frac{q(t)}{v(t)} \right) + k_3 (1 - v(t))]$$

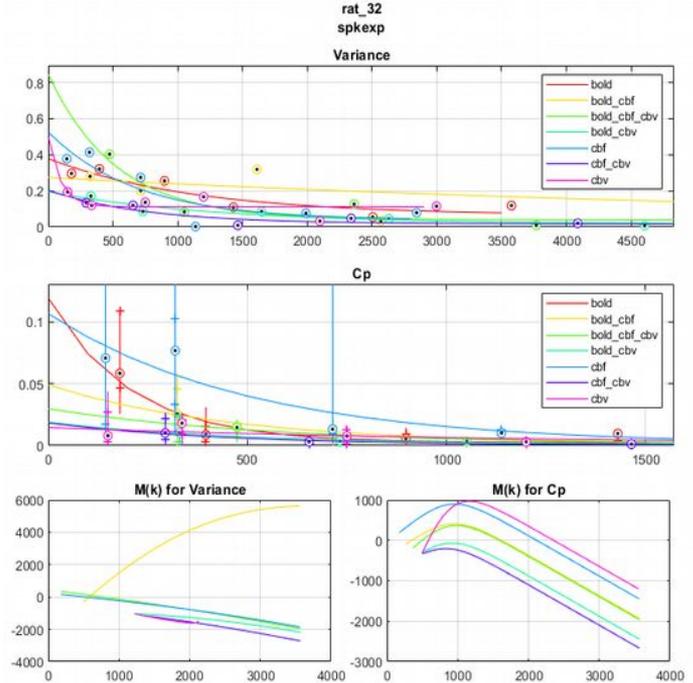

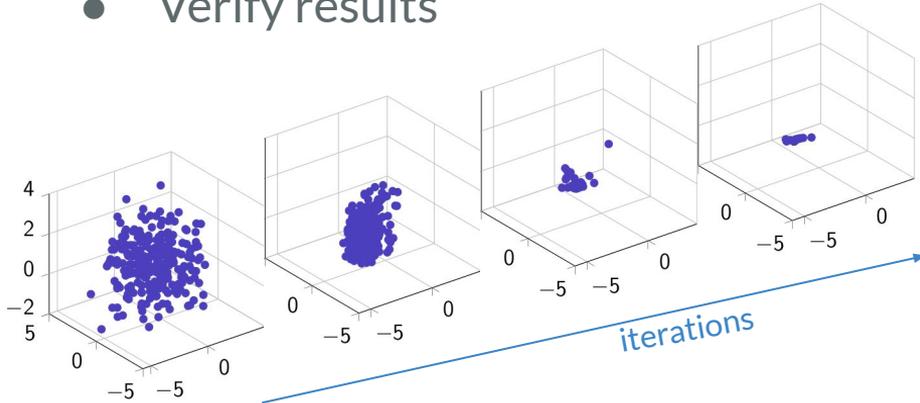

$$k_1 = 4,3 \theta_0 E_0 TE, k_2 = \epsilon r_0 E_0 TE, k_3 = 1 - \epsilon$$

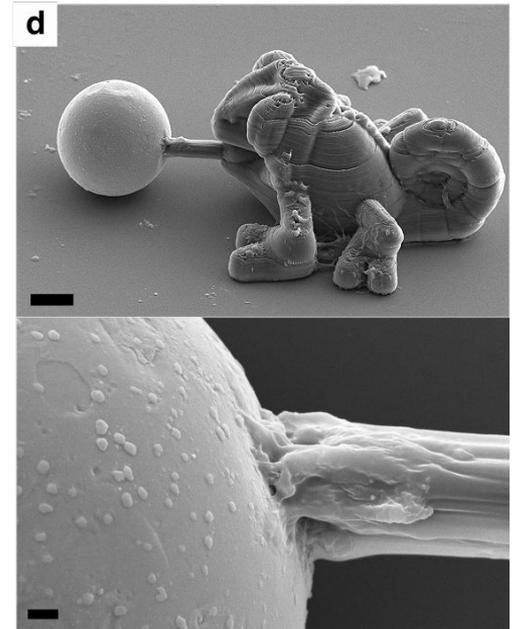

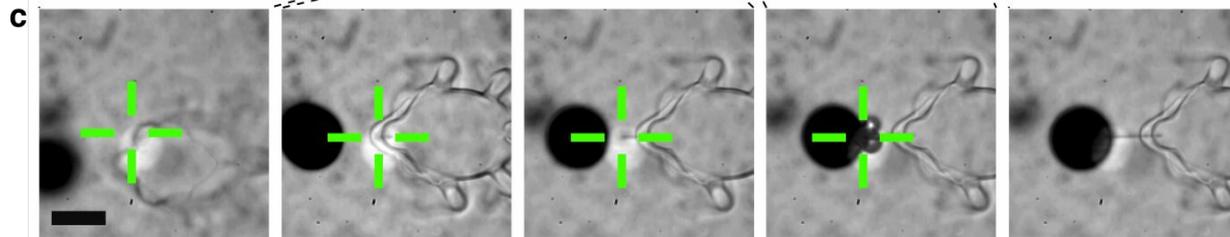

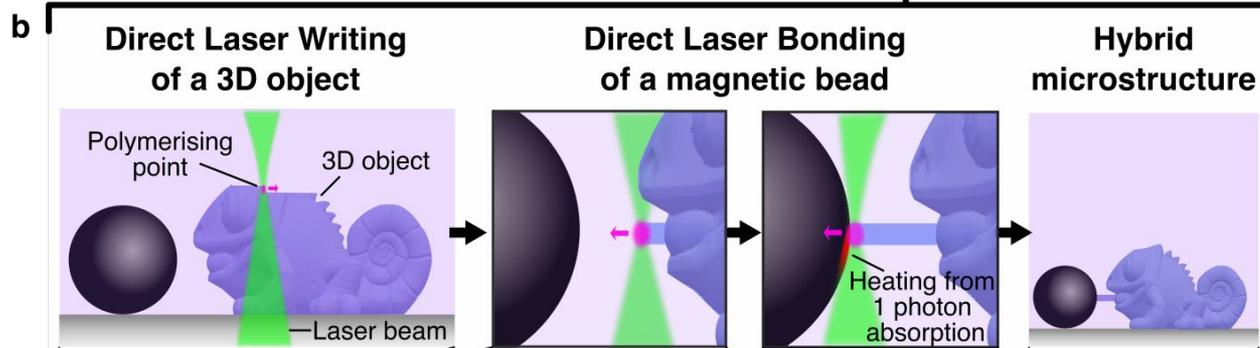

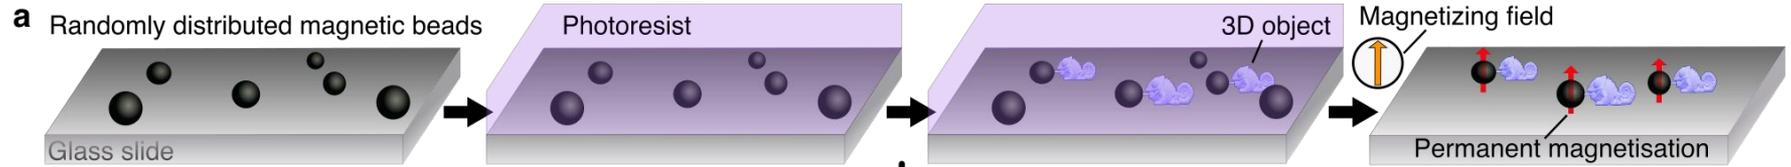

Scientific work - 2/2

my role

- Add and alter functions
 - Analyse data from fit
 - Display results
- Deal with the large amount of data
- Assess data informativeness
- Choose measure of uncertainty
- Verify results

MANUFACTURING

4D printing and robotics

Carmela de Marco, Salvador Pané, Bradley J. Nelson*

Shape-memory materials and two- or three-dimensional printing techniques combine to form a new paradigm that will advance robotics.
